Winning Team VI

Winning Team: DEEGRO.w!

Problem

- Deforestation and soil fertility loss are prominent catalysts for climate change, having significant implications
- A large portion of the global population remains uninformed and lacks the necessary motivation to consistently contribute towards achieving the crucial target of limiting global warming to 1.5°C.

Solution

- **Gamification approach** → role-playing game featuring various components of an ecosystem
- Players represent villagers with specific functions. Their goal is to feed their families at the end of each season with the resources produced by their activities which also determine the rate of soil degradation and its capacity to regenerate natural resources
- A grid summarizing the results of the game can be generated to facilitate group discussion
